

Demo Task Instructions – DevNuts Internship

To help us understand your skills better, we've prepared a demo task based on the screenshots attached.

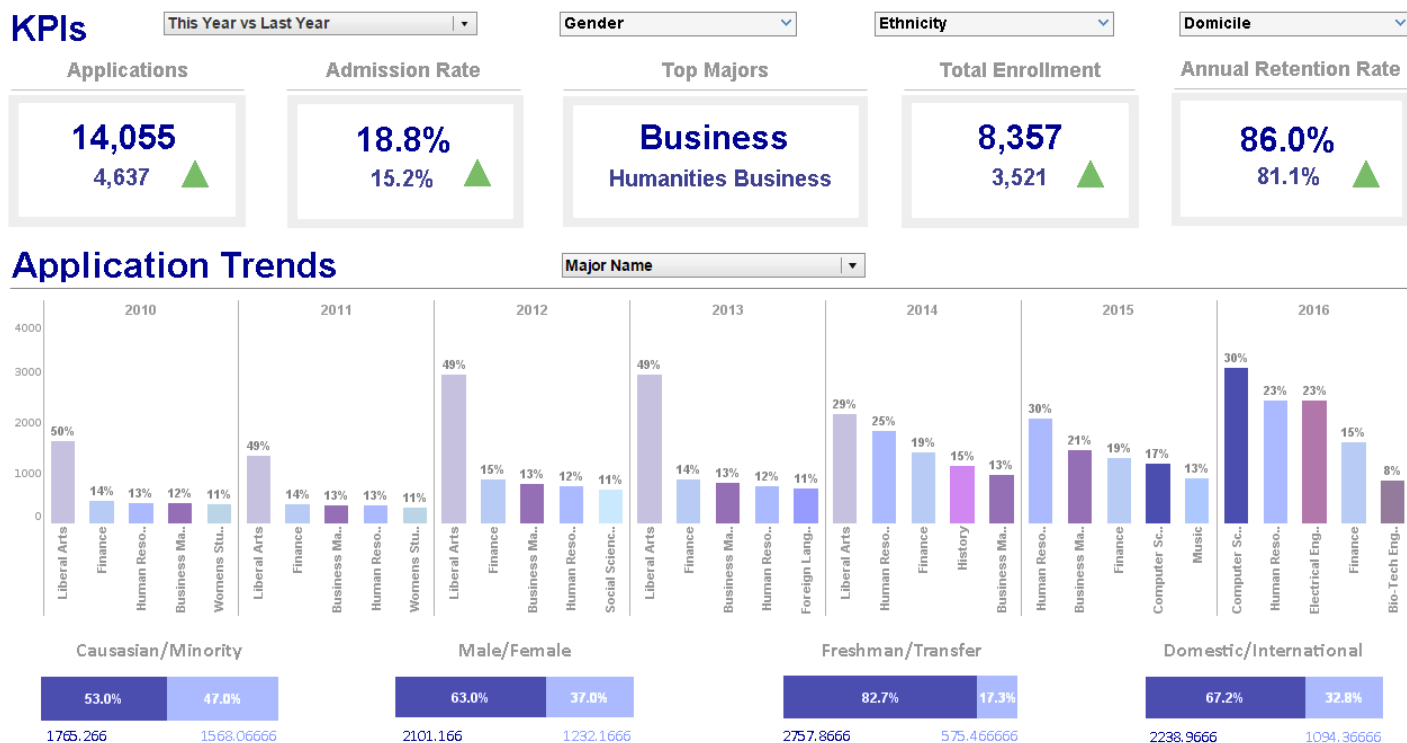

About the Demo Screenshots:

The attached dashboards display analytics related to student applications, enrollment trends, demographics, and termination reasons—commonly seen in educational institution admin panels. They represent data visualization with a clean, interactive UI and detailed metrics.

Your Task – MERN Stack Web App

Objective:

Build a responsive dashboard-style MERN app (MongoDB, Express, React, Node.js) that visually displays the kind of data shown in the screenshots.

Key Requirements:

- **No authentication required** (Skip login/signup).
 - All data should be **fetchd directly from the backend**, where you'll manually store sample data in MongoDB.
 - You must implement **interactive visualizations** (charts, graphs, metrics).
 - Maintain a **professional, modern UI** similar to the screenshots.
-

Recommended Workflow:

1. **Start with Backend:**
 - Design and create API endpoints in Node.js/Express.
 - Store sample data in MongoDB (similar to what's shown in the screenshots: enrollment trends, demographics, application counts, etc.).
 - Structure data properly to support multiple chart types (e.g., bar, stacked bar, pie, percentage).
2. **Move to Frontend:**
 - Use **React** with a component-based architecture.
 - Integrate chart libraries like **Recharts**, **Chart.js**, or **Nivo**.
 - Fetch data using **Axios or Fetch API**.
 - Focus on responsive layout, clean UI, and proper spacing/color usage.

Note, if you think you are expert in front end start the front end first

Evaluation Criteria:

- Clean code (frontend/backend separation)
- Accuracy of data representation
- Visual design and interactivity
- How well the dashboard matches the complexity and purpose of the samples
